1 Navigation - Using Dueling Network (DN)

You are welcome to use this coding environment to train your agent for the project. Follow the instructions below to get started!

1.0.1 1. Start the Environment

Run the next code cell to install a few packages. This line will take a few minutes to run!

```
In [1]: !pip -q install ./python

tensorflow 1.7.1 has requirement numpy>=1.13.3, but you'll have numpy 1.12.1 which is incompatible ipython 6.5.0 has requirement prompt-toolkit<2.0.0,>=1.0.15, but you'll have prompt-toolkit 3.0.
```

The environment is already saved in the Workspace and can be accessed at the file path provided below. Please run the next code cell without making any changes.

```
In [2]: # Imports.
    import matplotlib.pyplot as plt
    %matplotlib inline

# High-resolution plots for retina displays.
    %config InlineBackend.figure_format = 'retina'

import os
    import torch
    import numpy as np
    import time
    import random

# Hide any deprecate warnings.
    import warnings
    warnings.filterwarnings("ignore")

# Utility imports.
```

```
from collections import deque
        from unityagents import UnityEnvironment
        # Agents interact with, and learns from environments.
        from agent import Agent
        # Please do not modify the line below.
        env_path = "/data/Banana_Linux_NoVis/Banana.x86_64"
        env = UnityEnvironment(file_name=env_path)
INFO: unityagents:

Obtain NVidia GPU information

```
In [3]: # Set the working device on the NVIDIA Tesla K80 accelerator GPU (depending on availabil
    # Otherwise we use the CPU.
    device = torch.device('cuda' if torch.cuda.is_available() else 'cpu')
    print('Using device:', str(device).upper())
    print()

# Log additional info (when using the NVIDIA Tesla K80 accelerator).
# See <a href="https://www.nvidia.com/en-gb/data-center/tesla-k80/">https://www.nvidia.com/en-gb/data-center/tesla-k80/</a>.
    if device.type == 'cuda':
        print(torch.cuda.get_device_name(0))
        print('Memory Usage:')
        print('Allocated:', round(torch.cuda.memory_allocated(0)/1024**3,1), 'GB')
        print('Cached: ', round(torch.cuda.memory_cached(0)/1024**3,1), 'GB')

Using device: CUDA

Tesla K80

Memory Usage:
```

Allocated: 0.0 GB Cached: 0.0 GB

Environments contain *brains* which are responsible for deciding the actions of their associated agents. Here we check for the first brain available, and set it as the default brain we will be controlling from Python.

1.0.2 2. Examine the State and Action Spaces

Run the code cell below to print some information about the environment.

```
In [5]: # Reset the environment.
        env_info = env.reset(train_mode=True)[brain_name]
        # Number of agents in the environment.
        print('Number of agents:', len(env_info.agents))
        # Number of actions.
        action_size = brain.vector_action_space_size
        print('Number of actions:', action_size)
        # Examine the state space.
        state = env_info.vector_observations[0]
        print('States look like:', state)
        state_size = len(state)
        print('States have length:', state_size)
Number of agents: 1
Number of actions: 4
States look like: [ 1.
                                            0.
                                                         0.

States have length: 37
```

0.

1.0.3 3. Take Random Actions in the Environment

In the next code cell, you will learn how to use the Python API to control the agent and receive feedback from the environment.

Note that in this coding environment, you will not be able to watch the agent while it is training, and you should set train_mode=True to restart the environment.

```
In [6]: env_info = env.reset(train_mode=True)[brain_name] # Reset the environment.
        state = env_info.vector_observations[0]
                                                            # Get the current state.
                                                            # Initialize the score.
        score = 0
        while True:
            action = np.random.randint(action_size)
                                                            # Select an action.
            env_info = env.step(action)[brain_name]
                                                            # Send the action to the environment.
            next_state = env_info.vector_observations[0]
                                                            # Get the next state.
                                                            # Get the reward.
            reward = env_info.rewards[0]
            done = env_info.local_done[0]
                                                            # See if episode has finished.
                                                            # Update the score.
            score += reward
                                                            # Roll over the state to next time st
            state = next_state
                                                            # Exit loop if episode finished.
            if done:
                break
        print("Score: {}".format(score))
```

1.0.4 4. It's Your Turn!

Score: 0.0

Now it's your turn to train your own agent to solve the environment! A few **important notes**: - When training the environment, set train_mode=True, so that the line for resetting the environment looks like the following:

```
env_info = env.reset(train_mode=True)[brain_name]
```

- To structure your work, you're welcome to work directly in this Jupyter notebook, or you might like to start over with a new file! You can see the list of files in the workspace by clicking on *Jupyter* in the top left corner of the notebook.
- In this coding environment, you will not be able to watch the agent while it is training. However, *after training the agent*, you can download the saved model weights to watch the agent on your own machine!

Define the Training Function

```
eps_start (float): Starting value of epsilon (), for epsilon-greedy action selection
    eps_end (float): Minimum value of epsilon ()
    eps_decay (float): Multiplicative factor (per episode, ) for decreasing epsilon
11 11 11
# List containing scores from each episode.
scores = []
# List the mean of the window scores.
scores_mean = []
# Last 100 scores.
scores_window = deque(maxlen=100)
# Initialize epsilon ().
eps = eps_start
for i_episode in range(1, n_episodes+1):
    state = env.reset(train_mode=True)[brain_name].vector_observations[0]
    score = 0
    for t in range(max_t):
        action = agent.act(state, eps)
        env_info = env.step(action)[brain_name]
                                                      # Send the action to the envi
        next_state = env_info.vector_observations[0] # Get the next state.
        reward = env_info.rewards[0]
                                                        # Get the reward.
        done = env_info.local_done[0]
                                                        # Gee if episode has finished
        agent.step(state, action, reward, next_state, done)
        state = next_state
        score += reward
        if done:
            break
    # Save most recent score.
    scores.append(score)
    # Save most recent score.
    scores_window.append(score)
    scores_mean.append(np.mean(scores_window))
    # Log the scores.
    print('\rEPISODE {}\tAVG SCORE: {:.4f}\tEPS: {:.4f}\tLEARNING RATE: {}'
          .format(i_episode, scores_mean[-1], eps, agent.lr_scheduler.get_lr()), end
    # Decrease epsilon.
    eps = max(eps_end, eps_decay*eps)
    if i_episode % 100 == 0:
        print('\rEPISODE {}\tAVG SCORE: {:.4f}\tEPS: {:.4f}\tLEARNING RATE: {}'.form
```

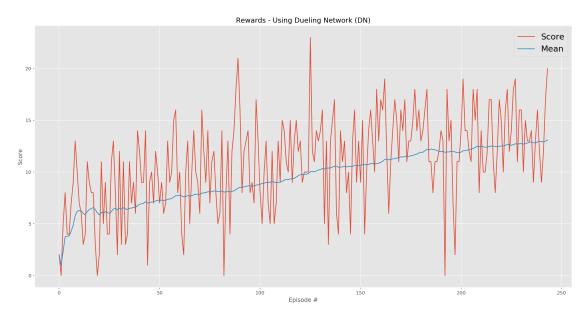

```
if np.mean(scores_window) >= 13.:
                                                     print('\n\nEnvironment solved in {:d} episodes.\nAverage score: {}.'.format(
                                                               i_episode-100, np.mean(scores_window)))
                                                     torch.save(agent.qnetwork_local.state_dict(), 'models/checkpoint_dn.pth')
                                                     print("Model saved successfully.")
                                                     break
                                # Return the scores.
                               return scores, scores_mean
Create and Train the Agent
In [9]: # Initialize a DQN agent instance.
                     agent = Agent(
